

Website Development Report: *100 Bloom Floral Website*

1. Project Overview and Objectives

The primary aim of this project was to design and develop a professional, multi-page website for a floral business known as 100 Bloom, utilising HTML and CSS as the core development technologies. The website was intended to establish a strong digital presence for the business by effectively showcasing its products and services while enhancing customer engagement and brand visibility.

The project objectives included the creation of an aesthetically appealing and functional website that would provide users with intuitive navigation, present information in a structured manner, and reflect the identity of a premium floral brand. Additionally, emphasis was placed on implementing responsive web design principles and maintaining consistency through reusable styling techniques.

The completed website comprises five key pages: Home, Services, Collection, About, and Contact, each serving a specific communicative and functional purpose.

2. Design Decisions and Rationale

A major design consideration involved the establishment of a visual identity that aligns with the elegance and sophistication typically associated with floral businesses. I have also taken a look at other businesses like Net Flourist. A carefully selected colour palette featuring cream, blush pink, rose, and sage green tones was incorporated to evoke warmth, natural beauty, and refinement.

Typography was also selected strategically to enhance both readability and visual appeal. The Cormorant Garamond typeface was utilised for headings to communicate elegance and luxury, while DM Sans was implemented for body text to ensure clarity and accessibility.

Furthermore, a consistent navigation system was incorporated across all pages to improve usability and facilitate seamless movement throughout the website. Visual hierarchy was reinforced through the use of spacious layouts, prominent headings, and strategically placed call-to-action buttons, thereby enhancing the overall user experience.

3. Description of Pages and Content

The Home page functions as the primary entry point and introduces users to the business through featured services, testimonials, floral showcases, and promotional content. The Services page provides detailed information regarding the company's offerings, including bouquets, wedding floral arrangements, corporate events, and curated gift packages.

The About page was developed to strengthen credibility by presenting the organisation's background, core values, team members, and company achievements. Meanwhile, the Contact page facilitates communication between customers and the business through an enquiry form and delivery-related information.

The Collection page, although currently underdeveloped, was designed to serve as a visual portfolio showcasing floral arrangements and featured work.

4. Technical Approach

The website was constructed using semantic HTML5, promoting improved accessibility, maintainability, and structural organisation. Essential semantic elements such as <header>, <nav>, <section>, <footer>, and <form> were employed to establish a logical content hierarchy.

Styling was centralised through an external CSS stylesheet to ensure consistency throughout the website. CSS variables were implemented to standardise colour schemes, typography, spacing, and transitions, thereby simplifying future maintenance and scalability.

Modern layout techniques, including Flexbox and CSS Grid, were utilised to create responsive and adaptable page structures. Additionally, interactive elements such as hover animations, transitions, and shadow effects contributed to an engaging and visually dynamic user interface.

5. Challenges Encountered and Solutions Implemented

One of the primary challenges involved maintaining design consistency across multiple pages. This issue was addressed through the use of a shared stylesheet and reusable CSS classes and variables.

Another significant challenge related to responsiveness across varying screen sizes. To overcome this limitation, responsive design techniques such as flexible units, CSS Grid, and Flexbox were employed to optimise usability across devices.

Additionally, certain HTML sections contained structural inconsistencies and incomplete elements. These challenges can be mitigated through code validation, testing, and refinement practices.

6. Future Improvements

Future developments could include the integration of JavaScript to introduce interactive functionality such as responsive navigation menus and enhanced form validation. Backend integration may also be implemented to facilitate message processing through the contact form.

Furthermore, expanding the Collection page into a complete gallery and incorporating e-commerce capabilities would significantly improve customer convenience and business functionality.

Conclusion

In conclusion, the 100 Bloom Floral Website successfully demonstrates the application of HTML and CSS in the development of a visually compelling and functional business website. Despite minor structural limitations and functions, the project effectively achieves its intended objectives through coherent branding, responsive layouts, and a consistent design framework. With further enhancements, the website has the potential to evolve into a fully operational digital platform for commercial use.
